Applied Multiple Regression Method with Exponential Functions: an Estimation of Traditional Catch Fishermen Household Income

Abd. Rahim^a and Diah Retno Dwi Hastuti^b

Study program of Development Economic, Faculty of Economic, Universitas Negeri Makassar, 90222 Indonesia

abd.rahim@unm.ac.id

Abstract: One of causes low households income of the traditional fishermen in Indonesia is due to seasonal changing issues (capturing and not capturing seasons). Thus, it has been affected to household's income of the traditional fishermen. We estimate affecting factors to household's income of the traditional fishermen in South Sulawesi Indonesia. The traditional fishermen of Barru District, are studied here as a case area that has low income during recent decades. Using Multiple Regression analysis with exponential functions, adjusted R², hypothesis testing of the regression (F-test and t-test), and followed by classical assumption tests (multicollinearity and heteroscedasticity) of the cross-section data from fieldwork, we found that the head household's education, education fishermen's wife, number of dependents, identity of differences housing of fishermen have been significant affected to household income of the traditional fishermen, whereas the age of the head household have not been significant affected.

1. Introduction

Traditional fishermen is a small-scale fisheries [1,2,3,4]. They are mostly found in coastal areas [5,6] and becomes one of the main important income sources of coastal communities in developing countries [7,8].

In Indonesia, traditional fishermen are mainly using a simple fishing gears in fish capturing [9] and have been used boats in sizing not more than five GT (gross-tonnage), including outboard motor and non powered motor boats [5,6]. However, the destruction of coastal ecosystems, including sea grass meadows and mangroves issues and subsequent consequence to fewer fish [10], the area of fishing ground have been further away from coastal areas.

Despite, their contributions often lack in quantification [8], but they have been provided a high contribution to the economic development of coastal areas [11]. In addition, they are contributed to sustainable livelihood [2,8], food security and support livelihood and well-being for more than 500 million people of coastal community in Indonesia and other developing countries [8]. However, majority traditional fishermen have been characteristic as poor communities [12,10] due to mostly have low income in fishing capture [8]. [13] revealed that the traditional fishermen is the largest poor in coastal community strata in many developing countries.

They have an attribute as the poorest of poor communities [14]. Data from [15] reported 32.14 % of 16.42 million people as coastal areas of Indonesia are still living below the poverty line with income indicator of US\$ 1 per day or per capita per month of US\$ 7-10 [16]. Thus, it affected to their food
