**Abstract.** The present investigation was carried out to characterize the bioactive compounds present in extract of *Holothurian atra* and *Holothurian edulis* using Gas Chromatography-Mass Spectrum (GC-MS) and antioxidan activity. The results of the GC-MS analysis provide different peaks determining the presence of 4 phytochemical compounds with different therapeutic activities. The measurement of antioxidant activity carried out using 1,1difenil-2-pikrihidazil (DPPH) method. The major, 9-Octadecenoic acid (Z)-, methyl ester (47.29), hexadecanoic acid, methyl ester (28.41), octadecanoic acid, methyl ester (4.47), and [1,1'-bibicyclo[2.2.2]Octane]-4-carboxylic acid (92.11) and minor compounds were also present. Antioxidant activity of the ethanolic extract of *Holothurian edulis* have low antioxidan activity with the value IC<sub>50</sub> 41.6828 mg / mL and ethanolic extracts of *Holothurian atra* have strong antioxidant activity with value IC<sub>50</sub> 33.514 mg / mL. From the results, it could be concluded that *Holothurian atra* and *Holothurian edulis* contains various bioactive compounds have various biological activities and antioxidant activity.

### 1. Introduction

5

Indonesian marine waters have a very high diversity of marine life that can be used for life. Apart from functioning as marine food, this marine biota is also very potential as a source of antitumor compounds, among which are derived from phylum Echinoderms [1]. Sea cucumbers are one of the members of spiny-skinned animals (echinoderms) scattered throughout the Indonesian sea waters, ranging from west to east. This animal is found in almost all beaches, ranging from shallow to 40 meters depth [2]. According to [3], the Ministry of Maritime Affairs and Fisheries made marine biotechnology a superior program since 2002. Rapidly developing marine biotechnology aims to utilize marine biota, by extracting bioactive compounds as medicines.

Content from this work may be used under the terms of the [Creative Commons Attribution 3.0 licence](#). Any further distribution of this work must maintain attribution to the author(s) and the title of the work, journal citation and DOI.

Bioactive compounds are secondary metabolites produced by microorganisms to defend themselves from threats that come from the environment and the animals around them. Marine animals are not protected from bacteria that tolerate high concentrations, fungi, and viruses, which may be pathogenic to these organisms, so these secondary metabolites are produced to defend themselves [4]. Secondary metabolites from marine biota have potential as anticancer, antiviral and anti-inflammatory [5].

Research on sea cucumbers as bioactives in Indonesia especially those originating from eastern Indonesia still need to be developed. Research on the potential of sea cucumbers in Indonesia, among others, as a vitality enhancer [6], antibacterial [7], antifungal [8]. Because it is necessary to do more research on other properties of sea cucumbers, for example as an antioxidant.

## 8. Materials and Methods

The tools used in this study were UV spectrometry, Erlenmeyer flasks, measuring cups, rotary evaporators, round bottom flask, analytical scales, dropper pipettes, micropipets, incubators, ose needles, knives, vials, funnels, test tubes, knives Refrigerator, Tweezers.

The materials used are methanol, ethyl acetate, materials for testing the bioactive content are Dragendorf reagent, Mayer reagent, Mg plate, Amyl alcohol, concentrated HCl, aquadest, and DPPH (1,1-diphenyl-2-picrylhydrazyl).

The research method used in this study is the experimental laboratories method. The stages of the extraction process are submerging the Holothurian Atra and Holothurian Edulis in fresh water for 1 day, wash and clean the bowels of the Holothurian Atra and Holothurian Edulis, cut the meat and then dried using a solar dryer. Holothurian Atra and Holothurian Edulis dried was macerated with ethanol in a ratio of 1: 4 for 48 hours. The filtrate is then evaporated using a rotary evaporator at 40°C.

## 3. Holothurian Atra and Holothurian Edulis Sample Extraction

Obtained from the waters of the Selayar Archipelago, the province of South Sulawesi, which is elliptical with a brownish-gray pattern and has black streaks on its back. The abdomen is white and all over the body surface there are rough spots, when touched it feels like sand. After weeding, the weight of Holothurian atra and Holothurian edulis is obtained clean is 3,200 grams which is then cut into small pieces and dried. The drying process lasts for 5 days. The dry weight of *H. scabra* is 560 grams, meaning the yield is 17.5%. Physical appearance of sea cucumber that is already dry, hard, stiff, brownish, smells a bit fishy, and contains a bit of lime on the surface of the body

## 4. Result and Discussion

GC-MS analysis of crude extracts of *Holothurian atra* contains 7 active components. Active components include 9-Octadecenoic acid (Z) -, methyl ester, Hexadecanoic acid, methyl ester, Octadecanoic acid, methyl ester, 9,12-Octadecadienoic acid (Z, Z) -, methyl ester, n-Hexadecanoic acid, Octadecanoic acid, methyl ester, 9,12-Octadecadienoic acid (Z, Z) -, methyl ester, n-Hexadecanoic acid, Hexadecanoic acid, methyl ester, 9,12-Octadecadienoic acid (Z, Z) Acid, Ethyl Ester, and Ethyl Oleate. The highest percentage of peak area is 9-Octadecenoic acid (Z) -, methyl ester. *Holothuria edulis* contains 3 active components, including [1,1'-Bibicyclo [2.2.2] octane] -4-carboxylic acid, 5- (1-bromo-1-methyl-ethyl) -2-methyl-cyclohexanol, and Hexadecanoic acid, ethyl ester (Table 1).

Antioxidant activity in *H. atra* increases with concentration remembering with a regression value of  $y = 1.0972x + 13,736$  and IC50 value 33,514. whereas *H. edulis* has antioxidant activity smaller than *H. atra* with an IC50 value of 41.6828 with a regression value of  $y = 1.0938x + 4.4072$

**Table 1.** Bioactive compound detected from ethanolic extract of *Holothurian atra* and *Holothurian edulis*

The gas chromatograms of *H. atra* and *H. edulis*<sup>1</sup> confirmed the existence of numerous interesting compounds with different retention times. The compounds were identified through mass spectrometry attached with GC. The identified compounds and their molecular formula, molecular weight, peak area (%) are given in Table 1; nature of the compounds and their biological activities are given in Table 3. Most of the identified compounds have been reported to possess interesting biological activities (Table 3). 9-Octadecenoic acid (Z)-, methyl ester, Hexadecanoic acid, methyl ester, Octadecanoic acid, methyl ester , 9,12-Octadecadienoic acid (Z,Z)-, methyl ester, n-Hexadecanoic acid, and Hexadecanoic Acid, ethyl ester.

**Table 3.** Activity of Bioactive compound identified in the ethanolic extracts of *Holothuria atra* dan *Holothuria edulis*

| Sr. No | Name of compound                               | Activity   | Reference    |
|--------|--|--|--------------|
| 1      | 9-Octadecenoic acid (Z)-, methyl ester         | antimicrobial activity<br>anticance activity   | [9]<br>[10]  |
| 2      | Hexadecanoic acid, methyl ester                | Antibacterial and antifungal<br>Antioxidant, decrease blood cholesterol, anti-inflammatory | [11]<br>[12] |
| 3      | Octadecanoic acid, methyl ester                | antibacterial  | [13]         |
| 4      | 9,12-Octadecadienoic acid (Z,Z)-, methyl ester | Anti-inflammatory and antiarthritic  | [10]         |
| 5      | n-Hexadecanoic acid                            | antioxidant  | [14]         |
| 6      | Hexadecanoic Acid, ethyl ester                 | Antioxidant, Hemolytic, Hypcholesterolemic, Flavor, Nematicide, Anti-androgenic            | [11]         |

<sup>15</sup> GC-MS analysis of crude extracts of *H. atra* and *H. edulis* <sup>1</sup> revealed presence of several bioactive compounds having strong biological activities such as antibacterial, antimicrobial, antifungal, anti-inflammatory, antioxidant, anticancer, antiarthritic, decrease blood cholesterol, hemolytic, and anti-androgenic.

<sup>12</sup> The presence of antioxidant activity in the extracts of *H. arta* and *H. edulis* (Table 2), <sup>9</sup> can be seen from the results of GC-MS measurements that the active components contained in both sea cucumbers have activity both as antioxidants and as anticancer. Research conducted by [15] found that sea cucumbers have potential as antioxidants. <sup>6</sup> Antioxidants are compounds that can inhibit the oxidation of other molecules.

## 5. Conclusion

This study reveals that, *Holothuria atra* dan *Holothuria edulis* <sup>2</sup> may also be considered as an important medicinal plant. In fact, six chemical constituents have been identified from a fraction of the ethanol extract by GC-MS analysis. A high percentage of these compounds is represented by fatty acids and phenol compounds which possess many desirable biological activities. The results, it could be concluded that *Holothurian atra* and *Holothurian edulis* <sup>3</sup> contains various bioactive compounds have various biological activities and antioxidant activity.
