ABSTRACT

This research was conducted to: (1) identify the frequently language learning strategies used by English department students in UNM, (2) identify proficiency level of English department students in UNM based on TOEFL score, (3) investigate the correlation between language learning strategies and proficiency level of English department students in UNM.

The research applied correlational research. The sample of this research was the fourth semester students in academic year 2013/2014. They were from three majors of study program at English department in UNM. Those were English education, English literature and business English. The sample was chosen by using stratified random sampling where the researcher chose the students represented three majors of study program who took TOEFL test provided by internal language services in English department namely CLS (Centre for Language Services). The sample consisted of 39 students from English education, 20 students from English literature and 18 students from business English. The data were collected through SILL questionnaire and documentation of TOEFL score. The data were analyzed by using descriptive and inferential statistic through SPSS 21.0 version.

The research result showed that (1) metacognitive and social strategies were the most frequently language learning strategies used by the English department students in UNM. This was proven by mean score 3.75 and 3.65 respectively. It was classified as high category of usage, range from 3.5-5.0 score, (2) based on TOEFL score, the proficiency level achieved by the English department students was classified into waystage level (basic user). It was showed by mean score 445.81, range from score interval 337-459, and (3) there was correlation between language learning strategies and proficiency level based on TOEFL score with $F = 2.288$. It showed that the value of $F_{\text{count}} = 2.288$ was greater than $F_{\text{table}} = 2.23$ ($F_{\text{count}} > F_{\text{table}}$), or $p = 0.045$ was lower than $\alpha = 0.05$ ($p < \alpha$). Therefore, the result indicated that language learning strategies of English department students had correlation with proficiency level.

Keywords: Language learning strategies, proficiency level, correlation
I. INTRODUCTION

There are a number of factors contributing to the success of students in learning a foreign language, particularly in learning English. Those factors are divided in two major factors, namely external and internal factors. The external factors cover some elements, such as teacher, method, media, and learning facilities. Meanwhile, the internal factors involve students’ internal factor which consist of age, cognitive, affective and personality. In other words, it can not be denied that students play important and influential role for the success in learning a language.

Starting from an assumption what makes students successful and more effective in learning than others, recently many researchers are interested in conducting researches that focus on investigating students as one of the factors in determining the successful or unsuccessful in learning. In the field of language learning research, learning strategies employed by the students have been seen as notable area. Chamot (2004) highlighted the importance of identifying students’ language learning strategies that enable teachers to discover their students’ learning strategies prior to teaching. By investigating students’ language learning strategies and its relationship with their language proficiency, it may facilitate a greater understanding of their learning problems. Therefore, understanding of language learning strategies can give useful information how to choose the best way in learning a foreign language and also help students to be more independent in learning. So it is very important for teacher/lecturer to introduce language learning strategies that can increase students’ proficiency.

II. LITERATURE REVIEW

A. The Concept of Language Learning Strategies

1. Theories of Learning

There are three sets of learning theories as follows:

a. Behaviorism Learning Theories

Behaviorism equates learning with changes in either the form or frequency of observable performance. Learning is accomplished when a proper response is demonstrated following the presentation of a specific environmental stimulus.
Behaviorism focuses on the importance of the consequences of those performances and contends that responses that are followed by reinforcement are more likely to recur in the future. The learner is characterized as being reactive to conditions in the environment as opposed to taking an active role in discovering the environment (Ertmer and Newby, 1993).

b. Cognitive Learning Theories

Cognitive theories stress the acquisition of knowledge and internal mental structures and, as such, are closer to the rationalist end of the epistemology continuum (Bower & Hilgard, 1981). Learning is equated with discrete changes between states of knowledge rather than with changes in the probability of response.

c. Constructivism

Constructivism is a theory that equates learning with creating meaning from experience (Bednar et al., 1991). Even though constructivism is considered to be a branch of cognitivism (both conceive of learning as a mental activity), it distinguishes itself from traditional cognitive theories in a number of ways. Most cognitive psychologists think of the mind as a reference tool to the real world; constructivists believe that the mind filters input from the world to produce its own unique reality (Jonassen, 1991).

2. Information Processing in Learning

According to Atkinson and Shiffrin (1968), the stage theory information process model recognizes three types or stages of memory: sensory memory, short-term or working memory, and long-term memory. Those stages are represented in the figure below.

![Figure 1: Information Processing Model of Human Learning.](image-url)
3. **The Definition of Language Learning Strategies**

“Strategy” comes from the ancient Greek term *strategia* refers to generalship or the art of war. It involves the optional management of troops, ships, or aircraft in a plan battle. The basic characteristics of strategy imply planning, competition, conscious manipulation and movement toward a goal. Gradually, the concept of strategies has become influential in education (Oxford, 1990: 7-8). Furthermore, Oxford (1990) defined learning strategies as specific actions taken by the learner to make learning faster, more enjoyable, more effective, and more transferrable to new situations.

4. **Factor Affecting Choosing Language Learning Strategies**

According to Gavrilidou and Psaltou-Joycey (2009), there are some factors that can affect learning strategies choice. They are as follows:

- a. Proficiency level
- b. Age
- c. Gender
- d. Motivation
- e. Learning style
- f. Field of study/career orientation
- g. Culture
- h. Beliefs
- i. Task requirements
- j. Language teaching method

5. **Oxford’s Classification of Language Learning Strategies**

There are six major groups of second language learning strategies that have been identified by Oxford. According to Oxford (1990), second language learning strategies consist of two major categories as follows:

- a. **Direct Strategies**

  Direct strategies are defined as “strategies involving mental process and directly influencing the target language,” (Oxford 1990: 14). Direct strategies is composed of memory strategies for remembering and retrieving new information, cognitive strategies for understanding and producing the language, and compensation strategies for using the language despite knowledge gaps.

- b. **Indirect Strategies**

  Indirect strategies are those supporting and managing language without directly involving the target language. Indirect strategies consist of metacognitive strategies, affective strategies, and social strategies.
6. **Method for Identifying Language Learning Strategies**

According to Gavrilidou and Psaltou-Joycey (2009), there are four ways for identification learning strategies choice. The four ways are:

a. **Interview**
b. **Diaries and Journals**
c. **Think-aloud Protocols**
d. **Questionnaires**

B. **The Concept of Proficiency**

1. **Definition of Language Proficiency**

Briere cited in Farhady (2010) states that the term 'proficiency’ may be defined as the degree of competence or the capability in a given language demonstrated by an individual at a given point in time independent of a specific textbook, chapter in the hook, or pedagogical method. Clark cited in Farhady (2010) defines language proficiency as the language learner’s ability to use language for real-life purposes without regard to the manner in which that competence was acquired.

2. **Measuring Language Proficiency**

The TOEFL test is an internationally accepted standard of English that measures the academic English proficiency of a non-native speaker of English. The TOEFL test is available in two ways as follows:

a. International Testing Program is divided into TOEFL CBT (computer-based or IBT) and TOEFL P&P (paper based).
b. Institutional Testing Program, there are two types of institutional testing program; they are Pre TOEFL (paper based) and TOEFL ITP (paper based).

### III. RESEARCH QUESTIONS

1. What language learning strategies are frequently used by English department students in UNM?
2. What is proficiency level of English department students in UNM based on TOEFL score?
3. Is there any correlation between language learning strategies and proficiency level of English department students in UNM?
IV. RESEARCH METHODOLOGY

A. Population and Sample

The population of the research was English department students in UNM academic year 2013/2014. They were the fourth semester English department students. They were 158 students of English education, 68 students of English literature and 115 students of Business English. The total of population was 341 students.

This research applied stratified random sampling. Stratification is used when the population reflects imbalance on characteristic of a sample. In this research, the researcher divided the sample into three groups represented three majors in English department.

B. Instruments

In this research, the researcher utilized two instruments. They were questionnaire and TOEFL score. SILL (Strategy Inventory for Language Learning) questionnaire was used to get data about students’ language learning strategies. The researcher distributed SILL to identify language learning strategies of the students. The second instrument was TOEFL score. The TOEFL score was used to get information about students’ language proficiency level.

C. Data Collection

The students were given TOEFL test by CLS. The time allotted to answer the test was 115 minutes. The students of English education were the first respondents that were tested on July 5th, 2014, followed by English literature on July 12th, 2014, and business English on July 19th, 2014. Then, the researcher took the TOEFL score of the students after distributing the questionnaire. It was collected from CLS. The last step, the researcher gave questionnaire to students after TOEFL test took place. The time allotted to answer the questionnaire was 20 minutes. The questionnaire was completed by the students and the researcher analyzed and interpreted it.

D. Data Analysis

1. The SILL Result Analysis

   a. After collecting the data from questionnaire, the students’ results were tabulated in the table 3.4.

2. Correlational Analysis

After collecting the data from analysis of questionnaire and ELTIC score, the data was analyzed by using statistical package for the social sciences (SPSS 21). Descriptive statistics, such as frequencies, means and standard deviation was used to investigate the most frequently language learning strategy used by the fourth semester English department students in UNM. Then, the researcher also used inferential statistics. The researcher applied multiple regression test. According to Gay et al. (2006:369), multiple regression equation uses variables that are known to predict (correlate with) the criterion variables. In order to identify the degree of correlation, the interpretation of correlation coefficient is presented in the table 3.6 as follows:

(Sugiyono: 2007)

V. FINDINGS AND DISCUSSION

1. The Students’ Language Learning Strategies

The findings of the research deal with research questions which were collected through questionnaire and TOEFL score. Language learning strategies consist of six categories. Those are memory, cognitive, compensation, metacognitive, affective, and social strategies. There are three majors of study that are elaborated, namely English education, English literature and business English. The data obtained from the SILL questionnaire were analyzed by using descriptive statistics with SPSS 20 version for windows. The research results are presented as follows. The table 1 shows the mean, standard deviation (SD), degree, rank of language learning strategies.

Table 1. Mean Score, Standard Deviation and Rank of Language Learning Strategies

<table>
<thead>
<tr>
<th>Strategies</th>
<th>English Education</th>
<th>English Literature</th>
<th>Business English</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Mean</td>
<td>SD</td>
<td>Rank</td>
</tr>
<tr>
<td>Memory</td>
<td>3.27</td>
<td>.59</td>
<td>3</td>
</tr>
<tr>
<td>Cognitive</td>
<td>3.25</td>
<td>.60</td>
<td>4</td>
</tr>
<tr>
<td>Compensation</td>
<td>3.16</td>
<td>.58</td>
<td>6</td>

<td>3.54</td>
<td>.72</td>
<td>2</td>
</tr>
<tr>
<td>Total Score</td>
<td>3.36</td>
<td>.47</td>
<td></td>
</tr>
</tbody>
</table>
As shown in table 1, the mean score of English Education (M=3.78) and English Business students (M=3.80) indicated that metacognitive strategies as the high frequently used strategies while for English Literature students, they prefer social strategies as the high frequently strategies used (M=3.91). Furthermore, the table 1 revealed that the least frequently used strategy was different. The lowest mean score for English Education (M=3.16) and Business English Students (M=3.01) showed that the strategies ranked as lowest is compensation strategies with mean score. Moreover, for English Literature students, cognitive strategies (M=3.21) is the least frequent strategies that were used by the English Literature students.

In this research, it can be concluded that the metacognitive and social strategies were the most frequently strategies that were used by the English department students in UNM with high frequency of usage. Meanwhile, compensation strategies was the least frequently used strategies that was used in medium frequency of usage. None of the six strategies placed in low frequency of usage. This study produced similar results to previous related finding of the language learning studies, especially in Indonesian context which was conducted by Weda (2005) who found that social strategies and metacognitive strategies were the most frequently used strategies, and compensation strategies was the least frequently used strategies. Moreover, the researcher was consistent with the previously studies (e.g. Radwan, 2011; Salahshour et al., 2012) which reported that metacognitive and social strategies were the most frequently used strategies, whereas compensation and affective strategies were the least frequently used strategies. However, the result of this research where social strategies as one of the highest frequently used strategies did not match with the findings of Chamot (2004) who reported that Asian second language learners tended to use more rote learning and language rules and less communicative strategies. Furthermore, the result of this current research was not fitted to some former results found by Ling-Wu (2008) and Yilmaz (2010). They reported that compensation strategies were mostly frequently used strategies. These previous results were inconsistent with this current research where the compensation strategies were the least frequently used strategies.
2. The Students’ Proficiency Level

The data collected from the result of TOEFL score by English department students from three majors of study program is presented in table 2. It is showed the mean score and standard deviation (SD).

<td>12</td>
<td>60</td>
</tr>
<tr>
<td>Total</td>
<td>39</td>
<td>100</td>
<td>20</td>
<td>100</td>
</tr>
</tbody>
</table>

As shown in table 4.28, from the total sample of three majors of study program, there was no student who got score in two highest level based on ETS classification score namely Effective Operational Proficiency and Vantage Level. In the next level, there were only 3 students who were in vantage level or they can be classified as independent users. Those were from English education students whereas from two other majors there was no student who can achieve score in the vantage level. Next, in threshold level, there were 29 students (37.66%) who got score in this level. It consisted of 17 students from English education, 8 students from English literature and 4 students from business English. In the waystage level, more than half of the total sample or 45 students (58.44%) can achieved score in this level. They can be classified as Basic Users. There were 19 students from English education, 12 students from English literature, and 14 students from business
English. It indicated that most of English department students in UNM were in the waystage level of proficiency based on score obtained in TOEFL.

3. The Correlation between Language Learning Strategies and Proficiency Level

The researcher used inferential statistic to investigate the correlation between students’ language learning strategies and proficiency level. Its result proved the hypothesis of the research. The result of correlation between two variables can be seen in the tables:

The correlation analysis using IBM SPSS version 21.0 of English Department students showed in the table 3 and 4.

a. Dependent Variable: Proficiency
b. Predictors: (Constant), Social, Compensation, Memory, Metacognitive, Affective, Cognitive

The researcher compared the value of $F_{count}$ and $F_{table}$, or probability values and $\alpha=0.05$. It refers to the interpretation if $F_{count} > F_{table}$ or $p < \alpha$, it can be concluded that there is correlation. Meanwhile, if $F_{count} < F_{table}$ or $p > \alpha$, it means that there is no correlation or relationship or those six language learning strategies simultaneously correlated to proficiency level. From the result of data analysis, it showed that the value of $F_{count} = 2.29$ was greater than $F_{table}= 2.23$ ($F_{count} > F_{table}$), or $p= 0.045$ was lower than $\alpha= 0.05$ ($p < \alpha$). Therefore, the result indicated that the null hypothesis ($H_0$) was rejected or it can be concluded that hypothesis ($H_1$) was accepted.

Tabel 4. Model Summary

<table>
<thead>
<tr>

<tr>
<td>1</td>
<td>.405a</td>
<td>.164</td>
<td>.092</td>
<td>45.60312</td>
<td>.887</td>
</tr>
</tbody>
</table>
Based on the result in the table above, it revealed $R = 0.405$. It can be interpreted that degree of correlation between language learning strategies and proficiency level was in moderate level. The Anova result in Table 3 showed the simultaneous correlation between language learning strategies as predictor variable and proficiency level as criterion variable. Meanwhile coefficient result revealed the partial correlation of each language learning strategy and proficiency level.

In Indonesian context, the result of this research was contradictory to the result findings of the research which was conducted by Maulina (2013). She reported that there was not significant correlation between language learning strategies used by both successful and unsuccessful male and female students and their English achievement.

On the other hand, this current research had similar result with the others which were found by Griffiths (2003), Ling-Wu (2008) Mohammadi (2009), and Chi and Tam (2013). These researches found that there is a positive correlation between language learning strategies and proficiency. Therefore, it can be considered that the students’ English proficiency level was influenced by other factors that might come from students’ factors such as language learning strategies applied by the students whether inside or outside of the classroom. Regarding to result of proficiency test, this research revealed that compensation strategies had partial correlation with the students’ proficiency level that the students achieved in TOEFL test. This may be due to the application of compensation during doing the test. The compensation strategies help the students making up for missing knowledge (e.g., guessing from the context in listening and reading; using synonyms). In doing test with limited time and a number of questions such as TOEFL, making up for missing knowledge such as guessing from the context and the using of synonym can become a clue to answer the question.

### VI. CONCLUSION

This research concluded that based on the result of language learning strategies employed by English department students from three majors of study program, the high frequently used strategies were metacognitive strategies and social strategies. Then, it was followed by medium frequently used strategies. Those were cognitive strategies, memory strategies, affective strategies, and compensation strategies. This leads to conclude that the
English department students in UNM were high to medium category users of language learning strategies. Based on the data analysis of the total sample from three majors of study program in English department, the mean score of TOEFL (M=445.81) showed that English department students’ proficiency level was in the waystage level with the range score 337-459.

There was correlation between students’ language learning strategies and their proficiency level. The data analysis showed that the value of $F_{\text{count}}= 2.29$ was greater than $F_{\text{table}}= 2.23$ ($F_{\text{count}} > F_{\text{table}}$), or $p= 0.45$ was lower than $\alpha= 0.05$ ($p < \alpha$). This result indicated that the null hypothesis ($H_0$) was rejected. This leads to conclude that there was correlation between language learning strategies and proficiency level.
